

Searching in Google Earth

To search for something in Google Earth, you can enter information in a variety of ways.

The first way is to enter an address. Enter as much information as you have.

Google Earth is usually accurate down to the street level, but may be off by a few houses due to way they receive information from the United States Postal Service. It approximates where your house would be based on the block number.

Another way to find a location is to enter the latitude and longitude of the place you are trying to find.

Google Earth also allows you to enter the name of a place without other information. For example, enter **pyramids** or **Washington Monument**. It will then fly to these places.
